

Santa Clara Valley Water District Qualifying Products List  
In-Line Drip Irrigation Equipment

Converting overhead irrigation to drip irrigation in existing shrub, perennial and annual planting beds can help reduce water loss from wind, misting, over-spray and runoff often associated with sprinkler systems. In-line drip tubing is recommended over conventional drip irrigation because it is less susceptible to clogging and fittings/emitters becoming disconnected, requires less maintenance, and has a longer useful life.

The following is a list of qualifying in-line drip tubing with a flow rate of 1 gallon per hour or less to be used for the Drip Irrigation Conversion Rebate. Please contact the Santa Clara Valley Water District to inquire about using any form of in-line drip tubing not on the list below. This list is not intended to be the qualifying list for any drip irrigation installed within the Landscape Conversion Rebate area.
